the problem:

Water bottles

are

awkward to fill
in fountains and sinks

and

hard to clean.

the solution:

rensa

washes and **sanitizes**
almost any size bottle

fills bottles 3x faster
than a standard
drinking fountain

rensa

smart electronics

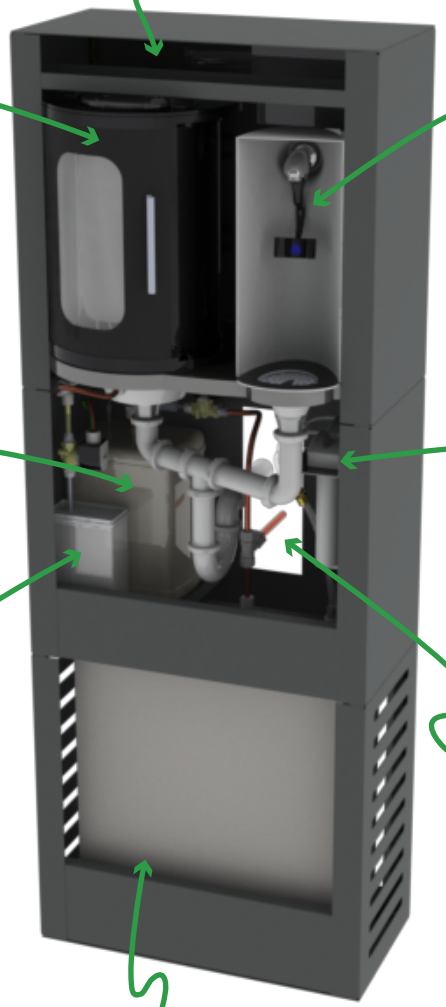
Components shut off when not in use to conserve energy. Wash cycle uses half as much water as handwashing.

washing chamber

Clamps hold bottle over wash nozzles for 30 second wash/rinse cycle. Door locks when in use.

filling chamber

Water dispenser fills a 1-liter bottle in 12 seconds -- 3X faster than a standard fountain.



heater

Washwater is heated to 180°F, killing 99% of bacteria.

filters

Tap water is filtered for best taste and purity. Filters are replaced every 6 months.

detergent

Valve releases detergent to remove oils and residue. Container holds over one month's supply.

installation

Rensa requires the same wall hookups as an ordinary drinking fountain: a 60psi water line, drain, and standard outlet.

chiller

Water is chilled to 55°F before dispensing. Chiller can cool up to 40 liters every hour.
